

Kinematics

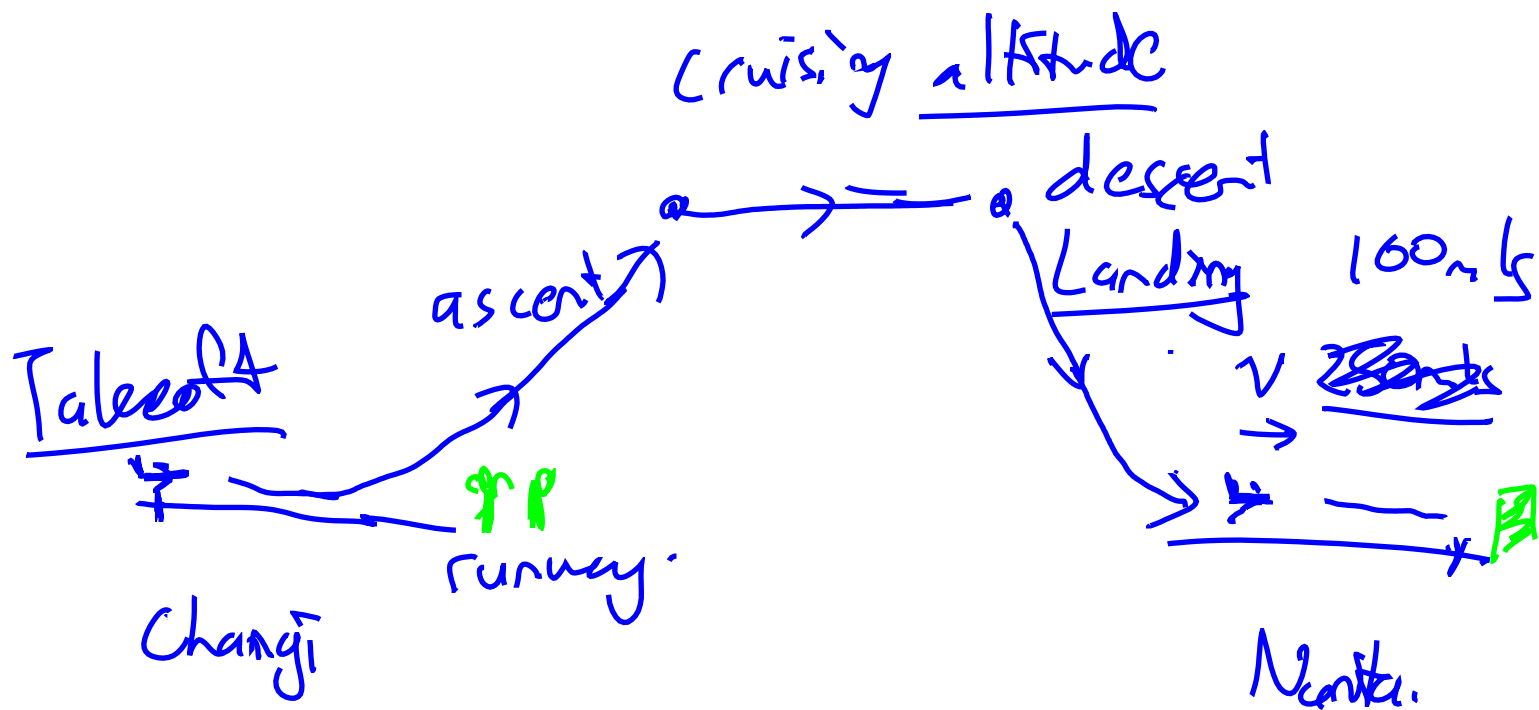

vectors = Quantities

w/

magnitudes

& direction.

How long does
your runway need to

Cruising

3500 km

700 km/h
- 800 km/h

displacement.

$$S = vt$$

velocity.

$$v = \frac{\text{distance}}{\text{time}}$$

A diagram showing a curved arrow pointing from point A to point B, representing distance.

$$\text{time} = \frac{\text{distance}}{v}$$

$$= \frac{3500(\text{km})}{700(\text{km/h})} = 5 \text{ h}$$

Direction becomes imp.

$$AD = \sqrt{3500^2 - 800^2}$$

$$= \underline{\underline{3407.3 \text{ km}}}$$

5 st.

$$Ac = 3000 \text{ km.}$$

$$BC = \sqrt{407.3^2 + 800^2}$$

$$\underline{\underline{B(L) (km)}} = (\sqrt{805,929}) \text{ km.}$$

$$= 897.7 \text{ km.}$$

$$A \overset{C}{\cancel{B}} + BC$$

$$= 3000 \overset{\text{km}}{\underset{\wedge}{+}} 897.7 \overset{\text{km.}}{\underset{\wedge}{}}$$

$$= 3897.7 \text{ km}$$

extra time taken

$$= \frac{3897.7 - 3500}{700 \text{ km/h.}}$$

$$= 0.5682 \text{ h}$$

$$= \underline{34.1 \text{ min}}$$

Detour example

↳ took $\sim \frac{1}{2}$ hr

longer to get from
A to B.

What is displacement
from A to B?

method 1 of rep vectors.

3500 km.

$$\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}}$$

$$= \frac{800}{3500}$$

$$\theta = \frac{\arcsin\left(\frac{800}{3500}\right)}{\sin^{-1}\left(\frac{800}{3500}\right)}$$

$$\sin^{-1}\left(\frac{800}{3500}\right)$$

$$\theta = \frac{0.2306 \text{ rad}}{\text{w.f.t}}$$

for π dir

0 is also
 13.24°

method 2 : use
"coordinates"
In 2D.

$$\vec{S} = \begin{bmatrix} S_x \\ S_y \end{bmatrix}$$

where

~~\vec{S}~~ = $S_x = 3407.3 \text{ km}$
 $S_y = 800 \text{ km.}$

$$\cos \theta = \frac{\text{adj}}{\text{hyp.}}$$

$$AD = 3500 \times \cos \theta$$

$$= 3500 \times \cos(0.2306 \text{ rad})$$

$$= \underline{3407.3 \text{ km.}}$$

$$BD = 3500 \times \sin(0.2306 \text{ rad})$$

$$= 800 \text{ km}$$
